

As a cargo transportation specialist, you understand the absolute importance of two things: shipments arriving on time and arriving in pristine condition. This means there is absolute importance in continuous real time cargo tracking.

This is where your friends at eeLink Technology have the best in cargo and container tracking devices, featuring the GPT-29, the best in tracking devices in the industry.

Many times product shipping requires multi-modal transport including ground, sea and air, depending on the particular product. This means the products are going to be moved frequently, by more than one person and more than one machine. Protecting the investment with shipment condition monitoring is of absolute importance to the shipper and to the receiver.

Here are a few of the advantages you will get when using the GPT-29 for all of your real time cargo tracking needs.

LOCATION

Logistics is a big business and requires constant monitoring. The GPT-29 provides real time tracking of all products. From the time it leaves the warehouse until its final destination, tracking is as simple as glancing at a computer screen.

CONDITION MONITORING

Certain products are sensitive to temperature and movement. While some of these factors cannot be controlled, today's improved transportation offerings mean monitoring and maintaining a consistent temperature is quick and easy. At the first sign of any problems, parties receive an update and can act accordingly.

CLOUD BASED

More and more products are moving to the cloud, where data is secure and easily retrieved in the case of massive data breach or loss. This means companies can keep and monitor routes, products and shipping companies to maximize profits, minimize loss and maintain the entire operation as fluidly as possible.

DRIVER SAFETY AND PERFORMANCE

The rules and regulations for professional drivers are strict and consequences are severe. Keeping the driver, cargo and others on the road is of paramount importance. Our GPT-29 means all involved stay within legal limits and determine efficiency.

INCREASE EFFICIENCY

There was a time not too long ago when a fleet of employees was necessary to monitor and maintain the shipments, logistics and driver performance. These days are long past as GPS tracking means a few clicks of a mouse on a computer screen is all that is necessary for the majority of logistics. This saves money, time and valuable human resources.

THEFT

Transportation theft is a multi-million dollar industry. A small device tucked into a crevice or wrapped into a pallet means the average thief will never discover they are being tracked. Imagine recouping losses from theft quickly, easily and without damage to product.

COSTS

Shipping is expensive. Working out the details of finding best routes is always an issue, particularly with larger shipping. The GPT-29 monitors driver habits and ensures drivers are not using company fuel for personal gain.

eeLink Technology is dedicated to making companies profitable, customers happy and drivers moving efficiently as possible.

More information on the GPT-29, including detailed specifications, is available at the website. Visit www.eelinktech.com for a full product line and <https://www.eelinktech.com/gpt29-smartest-in-transit-monitoring-device-for-real-time-tracking-monitoring-of-cargo-and-assets/> for the GPT-29.
